

Alonzo, M., Baker, M., Caplan, J., Williams, A., & Elmore, A.

Canopy composition drives variability in urban growing season length more than the heat island effect.

This study shows that variation in urban growing season length is more strongly influenced by canopy composition than by urban heat island intensity. It underscores the importance of species makeup when interpreting urban phenological patterns.

Anderegg, W. R. L., et al. (2018).

Hydraulic diversity of forests regulates ecosystem resilience during drought.

Examines how variation in hydraulic traits enhances forest resilience to drought stress. While not directly focused on phenology, it provides critical context for understanding climate sensitivity and vegetation response mechanisms.

Brunner, A. M., Varkonyi-Gasic, E., & Jones, R. C. (2017).

Phase Change and Phenology in Trees.

Reviews the genetic and physiological controls of phase change and phenology in trees. Serves as a foundational reference for interpreting observed phenological timing and variability.

Dai, W., et al. (2019).

Detecting temporal changes in the temperature sensitivity of spring phenology with global warming.

Applies machine learning techniques to identify shifts in temperature sensitivity of spring phenology under climate change. Demonstrates the utility of data-driven models for capturing non-linear phenological responses.

Dixon, A. K., Alonzo, M., Roberts, D. A., & McFadden, J. P. (2025).

Sensitivity of urban tree leaf phenology to precipitation and temperature in a Mediterranean climate city.

Uses high-resolution PlanetScope imagery to quantify individual-tree phenological responses to temperature and precipitation. Highlights climate sensitivity of urban trees even in managed, irrigated environments.

Furby, S. L., & Campbell, N. A. (2001).

Calibrating images from different dates to 'like-value' digital counts.

Introduces radiometric normalization techniques for multi-date satellite imagery. Provides foundational methods for ensuring consistency in time-series phenological analyses.

Gao, C., Wang, H., & Ge, Q. (2023).

Interpretable machine learning algorithms to predict leaf senescence date of deciduous trees.

Develops interpretable machine learning models to predict leaf senescence timing. Balances predictive performance with model transparency for phenological applications.

Garnot, V. S. F., et al. (2025).

Deep learning meets tree phenology modelling: PhenoFormer versus process-based models.

Compares deep learning phenology models with traditional process-based approaches. Highlights trade-offs between accuracy, interpretability, and mechanistic understanding.

Jensen, J. K., et al.

Contrasting effects of tree origin and urbanization on invertebrate abundance and tree phenology.

Explores how urbanization and tree origin influence phenological timing and associated ecological interactions. Demonstrates cascading biological effects of altered urban phenology.

Jochner, S., & Menzel, A. (2015).

Urban phenological studies – Past, present, future.

Provides a comprehensive review of urban phenology research and methodological evolution. Useful for framing contemporary urban phenological studies within a broader historical context.

Kong, D., McVicar, T. R., et al. (2022).

phenofit: An R package for extracting vegetation phenology from time series remote sensing.

Introduces the *phenofit* R package for standardized extraction of phenological metrics from remote sensing data. Widely used for deriving phenological events from satellite time series.

Kong, D., Xiao, M., et al. (2026).

phenofit: Extract Remote Sensing Vegetation Phenology (software).

Documents the software implementation and updates of *phenofit*. Serves as a technical reference for applied phenological analyses.

Meng, L. (2021).

Green with phenology.

Discusses the expanding role of phenology in ecological and climate research. Provides conceptual motivation for integrating phenology into environmental studies.

Pan, B., et al. (2025).

Identify and track white flower and leaf phenology... with time series PlanetScope images.

Demonstrates the use of PlanetScope imagery to detect fine-scale flowering and leaf phenological events. Highlights the value of high-resolution data for capturing short-duration phenological processes.

Roberts, A. M. I. (2012).

Comparison of regression methods for phenology.

Evaluates multiple regression approaches for estimating phenological timing. Provides methodological guidance for phenology model selection.

Suleman, M. A. R. (2025).

Application of Remote Sensing and Machine Learning in Vegetation Phenology and Climate Change Studies.

Synthesizes remote sensing and machine learning applications in phenological research. Useful for contextualizing individual studies within broader analytical trends. *Some Chapters Seem Like They Could be Useful*

Wang, H., & Gong, F.-Y. (2024).

Quantifying City- and Street-Scale Urban Tree Phenology...

Integrates PlanetScope, Sentinel-2, and Landsat imagery to analyze urban tree phenology at multiple spatial scales. Demonstrates scalable methods for urban phenological monitoring.

Wang, J., Zhang, X., & Rodman, K. (2021).

Land surface phenology... An application of machine learning in phenological modeling.

Uses machine learning to assess drivers of land surface phenology following wildfire disturbance. Illustrates the influence of climate and land cover on phenological recovery.

Wu, Z., et al. (2025).

Tree species composition governs urban phenological responses to warming.

Shows that species composition mediates urban phenological responses to warming. Reinforces the importance of biodiversity in shaping climate sensitivity in cities.
